

Prompt 1:

Act as a Senior AI Engineer and Security Engineer.

Build a complete Security Advisory Digest MVP.

Requirements:

Read stack.yaml inventory files.

Fetch advisories from GitHub Security Advisories, NVD API, and OSV API.

Normalize advisories into a common schema.

Store advisories in SQLite.

Implement advisory matching against inventory products.

Implement an Agent Loop that:

- Reads inventory

- Fetches advisories

- Matches affected products

- Determines severity

- Generates findings

Generate Security Advisory Digest reports in Markdown.

Build FastAPI APIs:

- POST /inventory/upload

- POST /scan

- GET /report

- GET /health

Build Streamlit UI:

- Upload Inventory

- Run Scan

- View Findings

- Download Report

Use Ollama + Llama3 for report summarization.

Add logging, validation, error handling, type hints, and modular architecture.

Generate folder structure, source code, sample data, requirements.txt, tests,

README, and AI_USAGE_NOTE.

Create the entire project end-to-end.

Prompt 2:

Act as a Senior QA Engineer.

Analyze the entire Security Advisory Digest project.

Perform:

- Functional testing

- API testing

- Database testing

- Agent workflow testing

- Streamlit UI testing

Verify:

- Inventory upload

- Advisory fetching

- Advisory matching

- SQLite storage

- Report generation

API responses

Prompt 3:

Act as a Senior Staff Engineer.

Review the entire Security Advisory Digest repository.

Check:

Project structure

Code quality

AI capability

Agent Loop implementation

External API integration

Documentation

Test coverage

Demo readiness

Verify:

GitHub repository ready

README complete

Tests passing

Sample data present

AI Usage Note present

Demo scenario working

Generate:

Final architecture explanation

Complete workflow explanation

File-by-file explanation

Submission readiness checklist

Project score out of 10

Recommended improvements

If issues are found, provide exact fixes.
